CSR and leadership approaches and practices: a comparative inquiry of owners and professional executives

Abstract

This study generates comparative insights into CSR approaches of owners and non-kin professional executives in an emerging country context, Turkey. Drawing on 61 interviews, we found that ownership status of the executive is crucial in shaping their CSR perceptions and practices. Owner-executives are empowered in pursuing CSR approaches based on their personal preferences and values; they have mostly societal aims. Professionals display tendency for company-related CSR practice; they exhibit greater knowledge of CSR, and their CSR initiatives are the results of strategic choices to enhance their power within the corporation. Our paper contributes to the debate on the drivers for CSR by accounting for both societal and individual influences on the CSR agency of these two key groups of executives. First, we develop a typology of CSR approaches of owners and professionals. Second, we provide insights from an emerging country context. Third, we present empirically grounded practice implications for CSR.

Keywords: CSR, owner-executive, professional executive, Turkey, qualitative

INTRODUCTION

One of the most influential family business groups, Sabanci group, organizes Akbank Jazz Days as part of their corporate social responsibility (CSR) activities. Given the traditional cultural outlook of Turkey, only 3.8% of the Turkish population listens to jazz music (Hurriyet, 2011). Akbank Jazz Days is an illustrative example of arguably controversial nature of CSR decisions. The puzzle of how and as a result of what influences CSR decisions intrigued us in exploring the topic and we focused on one particular aspect of the problem,
which is the interplay between the owner vs. non-owner status of the company executive and their CSR perceptions/ practices.

We present a comparative investigation of CSR perceptions and practices of owners and non-kin professional executives, reporting on a qualitative study undertaken in Turkey. Public debates on socially responsible corporate practices have become commonplace in the aftermath of the global financial meltdown, and yet CSR frameworks, which are used to elaborate the expectations from corporations, are characterized by a wide range of conceptual definitions. Thus, it is crucial to start with conceptual clarity. CSR is ideologically framed; in this paper we conceptualize CSR as one form of business-society interactions that reflects particular ideological framing (Djelic and Etchanchu, 2017). How the nature, extent and impact of CSR has changed through time and space and co-evolved with shifts in dominant ideologies is important. Transformation of the intentions of leaders that motivate the exercise of CSR is significant. In-depth studies that examine motivations and practices of different groups of business elites are required to shed further light into our understanding of CSR.

The key questions we set out to answer in this paper are: How do owners (family member executives) and non-kin professional executives in Turkey perceive and practice CSR? In answering this question, we pay particular attention to the nuanced convergences and divergences in CSR approaches and practices. The Turkish business context is dominated by family business holdings, which grant a privileged position to owning family. Usually one or two families possess the majority of the shares and they are also present in the control of the company. However, as companies expand and are passed down through generations of owners, a community of professional executives also emerges. Therefore, it is important to investigate and compare the CSR perceptions and practices of owners and professional executives in order to understand CSR in the context of an emerging economy. Through a comparative approach, we are able to shed light on the factors that shape CSR practice. A
comparison of these two groups of upper echelons, who are distinct in terms of their legitimacy claims and their access to executive power and resources, provides insights into key drivers for adoption of various CSR practices.

In delineating the ideological and power-laden nature of CSR practice, our paper compares the CSR approaches and practices of owners and non-kin professional executives, who are arguably the two main groups of business leaders. A growing body of literature examines approaches and practices of owners (owner-executives) in the area of social responsibility, and highlights the significance of owners in developing and implementing CSR, particularly in the context of SMEs (Baumann-Pauly, Wickert, Spence and Scherer, 2013; Besser, 2012; Del Baldo, 2010; Fassin, Van Rossem and Buelens, 2010; Fassin, Werner, Van Rossem, Signori and Garriga et al., 2015; Jenkins, 2006; Lahdesmaki, 2012; Murillo and Lozano, 2006; Perrini, 2006; Russo and Tencati, 2008). However, there is a dearth of comparative studies examining perceptual differences between owners and professional executives. One particular study by Tafel-Viia and Alas (2009) analyzed such differences as sources of conflict in the context of Estonian SMEs. The authors argue that the focus of emphasis differs between owners and professional executives, mainly due to their different roles in an organization. Owners tend to develop and use CSR as a strategic tool in order to relate to certain interest groups and stakeholders, such as the state, politicians, media and public opinion, whereas professional managers focus on other stakeholder groups, such as suppliers, customers and employees. Nevertheless, the research on owners often focuses on the SME context. Our study makes a unique contribution by comparing leadership perceptions and practices of owners and non-kin professional executives in relation to CSR practice in 61 of the largest Turkish companies.

As noted, CSR needs to be understood on a particular and contextual form of business-society interactions that reflects and reveals certain institutional and cultural
conditions, particular relations of power and a given ideological grounding (Djelic and Etchantu, 2017, p. 644). Turkey constitutes an intriguing context to answer our research question for a number of reasons. Unsurprisingly, CSR is less studied in non-Western contexts, a gap which is even more acute when it comes to CSR perceptions and practices of owner- and professional executives in large companies. The very concept of CSR plays, in actual circumstances of Turkey, a well-placed tool for measuring the nature of perceptual mixtures that business-people develop to find a tactical path (De Certeau, 2002), which could serve them as actors to effectively exist in the highly competitive circumstances of the global market. Furthermore, Turkey has neither been colonized as most developing countries nor it experienced a Western-type of modernization. Yet it is characterized with an astonishing capability to adopt modern institutions through original synthesis, mostly channeling traditional values in modern forms. For example, as our study uncovers, the unique historical experience of Turkey in modernization is observed in the polysemic understanding of corporate social responsibility by owners, but mostly on philanthropic-basis. Consequently, the analysis of the perception and practices of CSR in Turkey has the potential for revealing, not only the existing variety of approaches to the concept, but especially the internal logic of a complex social change.

Situated at the intersection of Europe and Middle East and connected to the ancient Silk Road across Central Asia through Turkic culture after the fall of Soviet Union (Morgan, Hirsh and Quack, 2015), Turkey constitutes an interesting setting to study CSR practices. This is a melting pot where west and east as well as modern and traditional meet. In fact, while the policy shifts towards liberalization in 1980s relocated Turkey more into the mainstream of the world economy, the rise of Islamic parties in 2000s has created a business elite less unitary and more divided by the issues of religion, secularism and free markets (Morgan, Hirsh and
Quack, 2015). This intermingling of modern and traditional as well as frequent macro changes may have different repercussions on CSR understanding of the owners versus professionals in large business groups in Turkey. While the owners inherit the highest position in the power scale, the recent fast economic growth contributed to the size and status of the manager category in Turkish business system (Yamak and Ertuna, 2017). The latter with degrees in management and engineering from western-tradition higher education institutions are more exposed to western business practices (Yamak, 1998). In a longitudinal study, Yamak (2007) found that the concept of CSR was largely imported from the USA in Turkish academic circles, with no investigation of the previous CSR practices and concepts in this particular context. This strand of CSR literature misses previous sector or society level solidarity institutions and zakat mechanism. Therefore, the Turkish management literature on CSR appeared to be detached from the country specific context and history up to the early 2000s. Recent studies attempt to fill this gap and indicate that philanthropy originating from culture and traditions coexists with imported notions of CSR (Alakavuklar et al., 2009; Ertuna and Tükel, 2009; Küskü and Bay, 2012) contrary to the views of Ararat (2008), who maintains that societal influence is not strong on corporate behavior in Turkey, and that multinational companies with their control over their supply chain are among the major forces promoting, for example, environmentally-friendly technologies. This co-existence of modern and traditional may influence the way owner and professional executives understand and implement CSR. There are limited findings related to managerial behavior. Ascigil (2003) investigated managers’ understanding of CSR, and found that CSR is mostly perceived as a public relations issue. However, in her 2008 study conducted amongst professionals in Turkey, Türker observed that CSR activities positively contribute to commitment, and that they mostly reflect the personal interests, values and preferences of strategic leaders in Turkish companies whereby the majority of the shares belong to one or two families (Bulut
and Yumrukaya, 2009). CSR in Turkey appears to be of a philanthropic nature which, according to Robertson (2009), is consistent with the existing family ownership structure. At this juncture, it is essential to underline that particularly in culturally hybrid and dynamic contexts such as Turkey, CSR aspirations of owner- and professional executives may differ significantly and they may be prone to specific CSR approaches, knowingly or unknowingly as a result of the strong interplay between ownership status and executive agency. By focusing on this previously overlooked aspect of CSR practice, our study differentiates the owners from professional non-kin executives, and presents novel insights, which will be particularly relevant for similar societal contexts where traditional and modern mingles.

To summarize, the contribution of our study is threefold. First, we offer a typology of owners and non-kin professional executives that highlights characteristic differences in approaches and practices/actions pertaining to CSR. This typology is built around a key finding of the study that demonstrates a significant difference between owners and non-kin professional executives in their CSR perceptions and practices. We contribute to the literature by addressing a gap in the comparative understanding of CSR from an ownership and leadership perspective. Our paper demonstrated that the position of the executive vis-à-vis economic capital (i.e. ownership) is an important indicator of their notions of CSR. It is possible to locate both groups’ approach to CSR along a continuum, ranging from a lack of any notion of CSR to highly institutionalized practices referring to a particular macro-view of society. Thus, we contribute to the body of literature on the main drivers for, obstacles against and contradictions in CSR practice by introducing a typology that describes the executive agency for CSR as an outcome of the interplay between societal and individual factors, between material circumstances and personally held values and beliefs pertaining to CSR.

Our second contribution is that we offer original empirical insights on CSR in the context of an emerging country, Turkey. As explained above Turkey presents a relevant
context for our research. The majority of research on CSR has focused on understandings and practices in developed economies. Our study addresses this gap through an investigation of the topic in Turkey, which offers an interesting context within a dynamic socio-economic, political and cultural environment. Our findings reveal dual nature of CSR in Turkey, characterized by diffusionist tendencies for professional executives and traditional tendencies for owners.

Our third contribution pertains to the practical implications of our study. The investigation of the perception of different groups of business leaders (e.g., owners and professional executives) concerning CSR potentially have significant implications for CSR practice in terms of how to improve CSR understanding and practices in emerging country contexts. CSR remains to be an imported concept in most of the emerging country contexts; and hence we observe its artificial applications with taken-for-granted assumptions. We suggest that CSR responsiveness of business elites are embodied in their questioning and sense-making processes of their own assumptions, ideologies, motives as well as power. Featuring corporate executives as ‘moral agents’, which highlights the role of managerial discretion as a driver of CSR (Wood, 1991; Carroll and Bucholtz, 2006), our findings advocate that a better understanding of the link between CSR perceptions and approaches of the executives underpins the development of a responsible leadership approach towards CSR.

The remainder of this article is structured as follows: Firstly, we discuss the conceptual underpinnings of our study. In this section, we begin by discussing our conceptualization of CSR with a focus on agency of CSR leaders. Next, we outline the research methodology. The research findings are then presented, followed by a discussion of key findings, and, finally, our conclusions.
CONCEPTUALIZING CSR WITH A FOCUS ON AGENTIC CAPACITY OF LEADERS

CSR has been conceptualized and debated from various perspectives. One of the most frequently cited studies is Carroll’s work (1979, 1981, 1991, 1999), which defined CSR as “the social responsibility of business, which encompasses the economic, legal, ethical and discretionary expectations that society has of organizations at a given point in time” (Carroll, 1979, p.500). Expanding on Carroll’s four pillars of CSR, Wood (1991) proposed a multi-level conceptualization and focused on CSR principles of social legitimacy (institutional level), public responsibility (organizational level) and managerial discretion (individual level) in defining the concept. Managerial discretion and practice (De Cremer et al., 2011; Carrington, Zwick and Neville, 2018; Legrand, Al-Ariss and Bozionelos, 2018) is fundamentally important in defining CSR, particularly for the purpose of this study.

In this paper, CSR is defined as an organization’s commitment and active response to issues beyond the narrow economic, operational, legal and ethical requirements of the business (Carroll, 1979, 1991, 1999), as a particular form of business-society interaction embedded in certain ideological and cultural conditions with associated power relations (Djelic and Etchanchu, 2017). It is about using the intrinsic capacity of the firm to improve the condition of its society through collaborative solutions to problems that arise due to market failures (Kemper and Martin, 2010). Aligned with this understanding, CSR initiatives entail a business organization contributing a combination of its resources for a social impact outside the normal scope of the corporation (Isaksson, Kiessling and Harvey, 2014). This expanded notion of CSR differs from a conventional understanding of it in terms of philanthropy; from a normative perspective that emphasizes compliance with standards relating to corporate behavior (Deakin and Whittaker, 2007; Epstein, 1987), and from the
market orientation perspective that insists on the relationship between CSR and the firm’s increasing competitive advantage (Brik, Rettab, and Mellahi, 2011).

CSR dynamics can be better understood by taking into account the socio-economic, political and institutional context. Political and societal expectations of business responsibility are important considerations. Scherer and Palazzo (2007) suggest a ‘political CSR’ perspective that has five interrelated dimensions: governance model, role of law (Elsayed, 2010), scope of corporate responsibility, source of corporate legitimacy, and the role of democracy. Role of governments in driving CSR particularly in emerging economies is illustrative of authoritarian capitalism, in the words of Hofman, Moon and Wu (2017). This debate is also related to a wider understanding of the people who constitute a corporation, including owner, professional executives and a whole range of stakeholder groups (Sison, 2009) and their expectations vis a vis business responsibility. The role of executives in driving CSR (see Cabeza-Garcia, Fernandez-Gago and Nieto, 2017) in the form of tuning their organizations into social concerns and engaging in value-laden organizational decision making processes (Swanson, 2013) to respond to multiple stakeholders is of fundamental importance.

Limited research has explored the implications of ownership, and shareholder rights and power for CSR (Angus-Leppan, Metcalf, and Benn, 2010; Arora and Dharwadkar, 2011; Mellahi, Frynas, Sun, Siegel, 2016; Waldman and Siegel, 2008). The propensity of corporations to engage in CSR is found to be associated with individual characteristics of CEO such as ownership rights, intellectual stimulation, values and leadership styles (Jiang, Zalan, Tse and Shen, 2018; Legrand et al., 2018; Groves and LaRocca, 2011; Waldman et al., 2006). For example, Du et al. (2013) investigate how leadership styles affect firm’s CSR practices and organizational outcomes. They argue that greater transformational leadership brings about more engagement with CSR. In another study, Vlachos et al. (2013) suggest that
a manager’s charismatic leadership influences employees’ interpretations of the motives underlying their organizations’ engagement in CSR. Jiraporn and Chintrakarn’s (2013) study on the effect of CEO power on CSR illustrate the significant impact of managerial power and agency on corporate CSR practices. They suggest that as the CEOs become more powerful, they increase investments in CSR, as they recognize wider benefits of CSR to themselves and to their organizations.

Moving Jiraporn and Chintrakarn’s (2013) argument forward we circumscribe CSR practice as outcomes of agency power relationship, rather than improvised or structurally determined duties. Following mainly the conceptualization of Giddens (1989) on agency, we assert that CSR-related agency of executives is tightly dependent on the ability to mobilize resources that are controlled by and constitutive of a high-grade executive position. Giddens (1989), in an effort to save the concept agent from both functionalist and hermeneutic notions of overly determined or overly autonomous acting subject, introduces a dialectical matrix in which reflexive monitoring, rationalization and motivation of action, are three dimensions of agency. Such a distinction means, in Giddens’ terms (1989), a constant interpenetration between unconscious (unintended) and conscious (intended) components of a social act. By inserting an intermediary level between unconsciousness and consciousness, Giddens (1989) underlines that between perceptively hidden aspects of an act and the intellectually pertinent state of it; there is the practical motives. In other words, Giddens (1989) attributes a particular importance to the practical knowledge issuing from an articulation of reflexive framing and unconscious motivations that construct an act. In this framework, agency is not considered solely a pure product of full or reflexive consciousness but is rather an encounter of the unconscious motives and rationally-oriented action, a knowledge of doing (Giddens, 1989). Our understanding of CSR activities and actions are based on such a conception of practice as
a function of confirming the agency-power relationship for owner and professional executives.

**METHODOLOGY**

*Research design and sample*

This is an exploratory qualitative study (Symon and Cassell, 2012; Myers, 2013) whereby we have sought to investigate an area that has been under-researched in the CSR domain. In this article, we report on a sub-section of findings of a broader study on Turkish business elites, which was carried out with a grant supplied by the Scientific and Technological Research Council of Turkey. This broader study included interrelated sections on CSR, corporate governance and strategy, political and business networks, entrepreneurial attributes, and gender and family dynamics amongst others. The interviews were conducted between August 2009 and February 2011. The sample of the study was drawn from top executives of the largest Turkish companies ranked by the Istanbul Chamber of Industry. Since we were keen to have a country-wide representative sample of the business elite, stratified random sampling was used. For this purpose, we have taken into consideration the regional breakdown of the 500 largest companies, and the sample included top executives from both rising and declining regions across Turkey. Approximately 45 per cent of the companies in our sample originate from Istanbul and the remaining 55 per cent from the rest of the country, reflecting the regional distribution of the largest companies in Turkey.

In defining owner-executives, we used having a kinship tie with the owner/founder of the company as the criterion. Top executives, who possess ownership stakes in the company and have kinship ties with the founder/owner family as extended family members (the
spouse(s), children, grandchildren and siblings of the founder(s), spouses of their children, grandchildren and siblings, nephews and nieces of the founder(s) and spouses of these nephews and nieces), were regarded as owner-executives (Selekler-Goksen & Usdiken, 2001). Professional executives were defined as top executives with no kinship links with the founder/owner family. The distributive attributes of our participants are presented in Appendix 1.

Data collection and analysis procedures

In this exploratory study, 65 open-ended narrative interviews were carried out with the key informants holding executive roles, such as the CEO, chair, or vice-chair of the board in each company. Of these, 61 interviews were deemed usable in terms of CSR questions and included in our analysis in the current article. Four interviews were excluded due to the fact that interviewees did not have time to answer the majority of the questions on business and society relations and CSR. Narrative interviews (see Alvesson and Ashcraft, 2013) allowed us to pay considerable attention to insightful accounts of participants.

The interview protocol included life stories of the participants as well as questions on the history of the company; business and society relations in terms of their interactions with the state, corporate CSR approach, strategies and practices; key drivers and motivation for CSR activities; and participants’ personal views on, and perceptions of CSR among other topics covered by the larger study. The interview protocol was a broad guide, which provided us with the opportunity to start with more generic questions and to ask for further elucidation in the course of the interview. This strategy enabled us to elicit different viewpoints and deeper insights into CSR and test our own evolving understanding of the CSR context in Turkish organizations. We framed our questions drawing on the existing literature as well as initial feedback we obtained through pilot interviews with top executives of five corporations.
Our interviews were structured along two axes (Bacharach, Bamberger and McKinney, 2000): first, informant’s background, knowledge, work and family context, and second, description of individual cases as life stories along with the company stories, focusing on different aspects along with business and society interaction, CSR-related stories, for the purposes of the current study.

The interviews were undertaken in the premises of the research participants. This has given us the opportunity to take field notes in relation to the office and the company. The awards, certificates and photos in relation to their CSR activities were important sources of information. We had the triangulation of data sources by using interviews, archival data and office observation. At least two researchers were present at each interview, except in two cases. Interviews typically lasted two to three hours and were tape-recorded. In two cases where tape-recording was not permitted, detailed notes were taken during the interviews. To improve the accuracy of the responses and adhere to research ethics, interviewees were assured that their replies would be kept strictly confidential. We have concealed the names of individuals and organizations by using numbers in our research report and consequent publications.

The data obtained through interviews were also crosschecked with the archival data. An extensive documentary search has been conducted in relation to each interviewee and firm using the Internet and database/electronic resources of libraries. Field notes and archival searches contributed significantly to our understanding of the context surrounding the participant and thus to better comprehend the interview narratives. We have applied thematic analysis to analyze the interview data. The usual procedure in thematic analysis entails methodical codification of empirical material. It consists of encoding qualitative data by using explicit codes, leading to themes, which are patterns identified in the data (Boyatzis, 1998). In line with narrative thematic analysis, we have employed a data-driven approach and
developed the codes and themes inductively. For reliability, two different researchers independently coded the data. When an agreement could not be reached among the two researchers, the theme was dropped from analysis or reconstructed until full agreement was reached between the researchers.

Our key focus in developing the codes and categories of themes related to CSR was on executive motives (linked to their legitimacy claims and access to power and resources) and key drivers for adoption of CSR approaches and practices including CSR understandings. Thematic analysis has allowed us to develop categories of themes to assess the scope of CSR understanding and practices of executives ranging from a level of no awareness or limited understanding of CSR (only in terms of economic responsibilities for instance), to a more holistic perspective of CSR embracing diverse types of stakeholders. These categories will be further illuminated when we present and discuss research findings. The interviews together with the field notes and archival data have been cut into first order and second order codes which led to aggregate themes drawing on Gioia et al.’s (2013) framework. The coding scheme that is generated through data analysis is presented in Figure 1.

Since our overall objective is to generate insights into an under-researched phenomenon through rich examples of CSR accounts by owners and professional executives, transferability (Lincoln and Guba, 1985; Patton, 2015), rather than generalizability, is aimed in this research. By generating a typology of CSR approaches of family member executives and non-kin professional executives, our aim is to demonstrate one potential way of looking into differences in motives and understanding and practices adopted by these groups of top executives in the context of CSR. As aligned with our conceptualization of agency (Giddens, 1989), interrelated dimensions such as reflexive monitoring, rationalization and motivation of
action are implicitly embedded in our analysis. Intra- and inter-group differences are brought to the fore of the discussion in order to delineate the categorization developed for the typology.

RESEARCH FINDINGS

The majority of the respondents – 80 per cent of the sample - were owners, consistent with the fact that family business groups and family management dominate the Turkish business system (Yamak and Ertuna, 2012; Buğra, 1994). Non-kin professional executives constituted the minority of final decision-makers, both at the single business level and business groups level, due to their relatively weak position in the Turkish business system (Yamak, Ertuna and Bolak, 2006).

We constructed a typology of CSR awareness and practices along a continuum, which encompasses varied tendencies among owners and non-kin professional executives as can be seen in Figure 2. This approach allowed us to compare the two key groups of executives as main categories, but also according to their inner varieties. Both extrapolations seem to have a crucial functionality for a better understanding of not only CSR practices, but also of the significant discrepancies between the perceptions of the very concept of CSR. Indeed, as shown below, before identifying different CSR projects and values underlying them, we have noted that a series of differences exists among top executives in terms of their conceptions of CSR.

Insert Figure 2 about here
In presenting the findings of our research, we first present the intra-group analysis followed by the inter-group analysis of owner- and professional executives, which form the basis of our evidence-based typology.

**CSR perceptions and practices of owner-executives**

Owners demonstrate important intra-group differences in terms of CSR perception and practices. At one end of our spectrum in Figure 2, there are owners who are unaware of, or insensitive to the CSR concept (i.e. ‘ignorant/insensitive owners’) and at the other end are those with sophisticated understanding and internalized commitment to CSR (i.e. ‘value-based owners’).

**Ignorant/insensitive owners:** This group is characterized by a lack of awareness of CSR, or with a low sensitivity to stakeholder needs and almost no reaction to the social and environmental dimensions of the business. The basic characteristic of the ‘ignorant/insensitive owners’ group is that they are all company founders. There is a considerable variation in company age, as they established their firms at separate times. All except one are university graduates and all are male (seven in total). Another striking issue is that, again except for one, they all have export-oriented and smaller size companies. Export orientation may decrease legitimacy creation need in local markets. For example, one of the interviewees, ignorant of the CSR concept, was totally focused on company profit and he had no awareness of corporate responsibilities towards employees, environment and other stakeholders. He had an internalized notion of exploitation of both human and natural resources as indicated in A1 in Table 1. Another participant defined company CSR activity as: “My daughter sold her artwork once to help the poor” (Male, 51, owner of a large industrial firm). Indeed, some of the owners had difficulty in understanding the concept when it was referred to as CSR and
responded to the question on whether they have CSR activities in the company with a simple “no”. Their concept of doing business did not include any particular sensitivity or reflection on their responsibilities towards stakeholders.

**Insert Table 1 about here**

**Pragmatist owners:** Next on the continuum is the group labelled ‘pragmatist owners’, who understand CSR and act upon CSR matters, reflecting conformist, instrumentalist and personal preferences on a transactional basis. Hence their practices do not go beyond the transactional pursuit of unsystematic and uncoordinated CSR activities, which mainly serve company interests. There are 17 owners in this category and all are male and university graduates. Their companies do not have a common characteristic in terms of age, size or export orientation.

In this group, we identified a group of owners, who perceived CSR as a tool for easing the life of the firm through networks with local regulatory institutions. For example, one respondent defined CSR along the lines of “providing what municipality asks from us” (Male, 51, owner of a large industrial firm). The same person stressed the “need of getting along with the municipality which otherwise may make life hard for the business”. He stated that he constructed a basketball ground for the municipality upon their request; similar comments were also made by several others. For this group of owners, CSR is seen from an instrumentalist approach, based on limited awareness of CSR matters and limited sensitivity to different stakeholders focusing only on those which will contribute to their business and which can even be considered as bribe in some instances (see A2-1 and A2-2 in Table 1).

Instrumentalism took different shapes and forms in terms of its extent, spanning from narrow business-driven instrumentalism, as demonstrated by A2-1, to future-oriented social...
The words of one of the respondents display how some owners linked CSR activities to the mid-term changes in the talent pool: “We have constructed high schools related to our industry.” (Male, 59, owner of group of companies). Others had more long-term, large-scale and explicitly ideological visions linking CSR and business interests as illustrates A2-2. In these instances, CSR is used as a medium for indirectly influencing national politics. In this group, there was a rational and instrumentalist pursuit of unsystematic CSR activities, based on personal preferences and requests that are made by local authorities and some fractions of the community. This demonstrates evidence to encounter between unconscious motives and rationally oriented action in navigating through decision making and implementation in relation to CSR.

**Paternalist owners:** Further along the continuum are owner who are expressively aiming to contribute to the society. We label this group ‘*paternalist owners’*. The paternalist owner has a CSR notion that is imbued with traditions and underpinned by religion in some cases. CSR activities appear as instruments of expressing the personal managerial power and will of owners. These 21 owners have different demographic characteristics and so do their companies. No pattern other than their predominantly provincial background could be observed in terms of their characteristics. We identified two sub-groups in this category: the first comprises of those paternalist owners who perceive CSR as the moral and implicitly religious duty of the ‘businessman’. They perform philanthropic acts on their own, rejecting the tax advantages they may have, and are usually the smaller scale owners within our sample of large corporations (A3-1 on Table 1). The second sub-group of paternalist owners includes those who undertake philanthropic activities, which are organized at company level and carried out in a relatively systematic way by setting up foundations. As the company grows, owners tend to prefer more institutionalized and regular large-scale activities. CSR activities
are organized through foundations of the enterprise or the family, which allow for more structured governance (A3-2 in Table 1). Forming an example to rationally oriented action, these findings also exemplify the dual nature of agency in terms of balancing between unconscious motives (e.g. religious motives and traditions) and deliberate action.

**Value-based owners:** Finally, the very end of the continuum is termed the ‘value-based owners’. This category represents the smallest group in our sample. Four out of 49 owners fit into this category. They are all university graduates and executives of diversified group of companies. Such value-based owners display an important level of personal involvement in CSR activities along different lines. Their perception of CSR is defined by personal self-actualization, and enlightened view of and individual responsibility towards the society which comprises a sustainability notion (A4-1 and A4-2). This type of owners’ CSR perception is imbued with a holistic approach to socio-economic and political issues in their surroundings, and not necessarily confined to their immediate community, and their CSR practices are therefore exemplified by activities that have an ultimate objective of affecting societal change along their ideologies, as delineated by the concept of reflexive monitoring. CSR projects and the values underpinning the companies of owners in this category tend to function on a higher register than the ordinary philanthropic activities undertaken by the economic actors. This can be construed as a form of undertaking political acts without concretely entering into the domain of the *realpolitik*. Value-based owners have a rounded perspective on CSR that brings about the execution of discretionary power in order to make an impact on the society. This shows the dialectical agency-power relationship as introduced in the preceding conceptual section of our paper.

In this group, CSR perception is highly value-based, and business ethics is strongly emphasized. CSR practices portray high sensitivity to stakeholders, community and the
environment, including, for example, investing only in the sectors where ethical behavior does not harm competitive position, and rejecting those industries, which are subject to unethical behavior. Such owners are actively involved in CSR activities, which are often categorized as corporate community involvement activities in areas such as education, the arts and sport. Personal involvement of owners in institutionalized and systematic CSR projects of their companies also provide them with the opportunity for self-actualization.

**CSR perceptions and practices of non-kin professional executives**

Contrary to owners, all the professional executives were found to be aware of the CSR discourse. Drawing on their managerial cultural and social capital (using capital in Bourdieuan sense; Bourdieu, 1986), non-kin professional executives tend to frame CSR as a strategic choice that can be utilized as a marketing or reputation management tool. Their perceptions are largely characterized by a business-oriented and utilitarian approach, with strong managerial motives, such as compliance with regulatory frameworks, enhancing company reputation and increasing sales. We observed intra-group differences among non-kin professional executives, similar to the case of owners. At one end of the continuum, we identify those professionals who have a basic understanding of, but little interest in CSR (i.e. indifferent professional executives), whilst at the other end are the non-kin professionals who have an advanced holistic understanding of CSR (i.e. value-based enlightened professional executive).

**Indifferent non-kin professional executives:** The professionals in this group display a limited understanding and practice of CSR, although they are professionally familiar with the concept. In some instances, they do not practice CSR at all as a part of their business activity (B1-1). In addition, non-kin professional executives in this group describe CSR in a detached
manner and do not demonstrate deep engagement. For example, CSR is sometimes seen as part of the marketing or branding strategy. One of the respondents explained that CSR activities in his company are devolved into distinct brands and merely used as a marketing tool to increase the sales of the firm’s different brands. This example illustrates that CSR is seen to have little relevance for the remit of the executive’s role apart from being a marginal brand management activity. In the companies where non-kin professional executives display such a limited CSR awareness and commitment, there is also a lack of philanthropic emphasis on CSR. The demographic characteristics of the two executives in this group are similar to those in other groups. They are all university graduates and male.

Corrective-instrumentalist non-kin professional executives: The next group in the continuum is the non-kin executives, who tend to take corrective action through CSR in order to balance the negative externalities borne out by corporate activities. We call this group as corrective-instrumentalists, whose members perceive CSR as a mechanism of compensation for the negative effect of the corporation on the society and the environment (B2-1 on the Table 1). In this group, the harmful environmental impact is the most commonly expressed area of concern that CSR activities aim to address. Professional executives in this group admit that corporations may have negative externalities, such as environmental pollution, and CSR is important to mitigate the harm caused by their activities. In this sense, CSR approach of this group is corrective and reactive in an attempt to compensate for the adverse corporate impact with little proactive commitment. An interesting tendency among this group of executives is the way CSR rhetoric is utilized in order to frame the negative corporate impact in positive terms. The professional executives in this group (2 in total) are university graduates and male and their companies display different background characteristics in terms of size, industry and foreign market exposure.
Pragmatist non-kin professional executive: Non-kin professionals, who form the next group in our typology, represent the largest majority with five professional top executives, who are all employed by large diversified holding companies. They are all university graduates. The only female professional executive of our sample is in that category. They are motivated by the firm’s growth through advanced corporate image activities supported by CSR initiatives. This group is one step ahead in terms of operationalization of CSR and its embeddedness within the business activity compared with the previous two groups. The practices in this group usually stem from a fully pragmatic schema of survival and reputation management. These are self-interested individuals who act upon the principle of pragmatic legitimacy (B3-1). Given that professionalism inevitably necessitates a highly rationalized conception of business, by converting every single activity into a profit-generation possibility, this group of executives tends to regard CSR as a growth opportunity for the firm. They appear to focus on the transformation of input to mainly economic output with an emphasis on the money spent on each activity and its impact. Their discourses highlight the monetary aspects of their CSR activities. This group of executives see CSR activities as a potential tool to secure their position in the company insofar as CSR accrues benefits for the business. Improved company performance strengthens the relatively precarious position that these executives occupy in the corporation. As a result, their CSR perceptions are more strongly influenced by immediate career concerns compared with that of owners, who are well-anchored by their ownership.

Value-based enlightened non-kin executives: This is the final group in our sample of professional executives, who have a holistic perspective of CSR in the sense that they embrace different stakeholders in the society and they are well aware of their responsibilities towards them. Their perceptions and understandings of CSR are underpinned by their moral
judgements about socially acceptable actions. All three top executives in this group diverge
significantly from the rest of the top executives. They emulate an owner-role, in that they
were called upon to undertake the creation and/or development of their companies (and
associated foundation, if any) on behalf of a large number of shareholders. Two of them are
university graduates and they are all male. The focus on justice and ethics in the company and
creating social benefits for society is striking in their discourse and endeavors. It is worth
noting that the companies they manage have specific ownership structures. While one
company is owned by a foundation, the other two are not affiliated with family businesses and
have a large ownership base. Another interesting point is that, compared to owners, their
discourse is less focused on society and more focused on internal stakeholders. One of the
executives in this group opposed company philanthropic activities, stating that these are
deducted from taxes. He maintained that those activities should be personal. Another top
executive in this group emphasized the importance of the harmony and satisfaction of the
workers and creating value for the society (B4-2)

**Comparing owner-executives and professional executives**

The CSR perceptions of owners and professional executives seem to differ considerably.
Differences not only appear at the perception level, but also at the level of involvement in
CSR projects. Owners are more inclined to consider CSR activities at the societal level, while
non-kin professional executives identify themselves with the activity and rationale of
managing. They are often limited by the boundaries of the enterprise and geared towards
rational and instrumental utilization of CSR. Professional executives tend to take on CSR
initiatives that are conceived strategically as conferring competitive advantage on the
corporation over its competitors. For example, instances of building schools, museums,
nurseries or facilities for the elderly people in their home towns are frequent among owners
and which is not the case for non-kin executives. They are more interested in CSR communication of the company and its organization. These differences are also attributable to the way in which owners and professional executives identify themselves with the business corporation and its foundations. Owners are highly ideological about their organization in terms of its objectives and its relationships with a diverse set of stakeholders including the society, and they hold the means to orient and direct resources toward the perceived demands of multiple stakeholders. Non-kin professional executives, on the other hand, whilst ideologically identifying with the corporation they manage, they do not have the managerial power in economic capital terms in most cases. They represent their corporations as highly rational individuals with certain kinds of motivation and expertise and strive towards capitalizing on CSR opportunities as they view stakeholder demands as opportunities to be leveraged for the interests of the company (C1-1 and C1-2). This is another example to rationalization aspect of agency, rationally oriented action dominating unconscious motives.

Exploring the CSR perceptions and practices in our research was intriguing, because of the existence of unexpectedly multiple ways, meanings and expectations of CSR, when a comparison of owner- and professional executives was carried out. As owners of the economic capital and granted with exclusive rights in the context of legal and corporate frameworks in Turkey, owner-executives are more empowered in developing and pursuing CSR matters based on their personal preferences and values. Professional executives, on the other hand, exhibit greater levels of knowledge of CSR, but the CSR initiatives they develop tend to be the results of strategic choices to ensure their survival and to enhance their power within the corporation.

Owner-executives emerge as powerful actors with multiple business interests and in close contact with the national and local administrations. As owners of economic capital, they can decide to divert some of the corporate earnings to CSR activities for reputational gains
and legitimacy building, enhancing relations with administrators and local communities, or for facilitating wider societal change in line with their personal values and ideologies. Strikingly, a substantive segment of the owner-executives has no notion of CSR, and a large majority has a traditional paternalistic approach to CSR. In some cases, traditional and paternalistic approaches to CSR appear to be underpinned by executives’ religious beliefs and philanthropic values. However, this does not fully represent ‘traditionalism’ in CSR. The traditional paternalistic approach to CSR is closely associated with a strategy of establishing and exercising power by owner-executives. This allows scope for highlighting the role of the executive agency in developing CSR approaches and programs. Such paternalistic owners, who form a large majority in our sample, express their executive agency through developing paternalistic (either traditional or institutionalized) approaches to CSR. Thus, related CSR activities become effective instruments of their agency. A result of such a panorama of executives indicates that the CSR definition, as it is conceptualized in managerial approaches, is not fully shared in Turkey, particularly among owner-executives who transpose their traditional perception of CSR, mostly as social aid driven by cultural or religious motives, onto the functions of their capitalistic enterprise. This should not be only seen as a simple lack of knowledge of owner-executives about the imported definition of CSR, which is also an important factor, but a tactical preference in an economy, which is both globalizing and remaining attached, in some respects, to the traditional social relationships.

Professional executives, on the other hand, need to seek legitimacy for their CSR decisions as they do not own the economic capital and thus lack the authority to allocate firm assets at their own discretion. As a result, although they have awareness of CSR, they tend to perceive it as an instrumental issue, or a managerial tool, often without culturally-oriented values.
DISCUSSION AND CONCLUSION

As noted, implications of ownership on CSR related agency of executives is under-researched (Angus-Leppan, Metcalf, and Benn, 2010; Arora and Dharwadkar, 2011; Mellahi, Frynas, Sun, Siegel, 2016; Waldman and Siegel, 2008) and often the analysis remained at individual level focusing on the influence of executive values and leadership styles on CSR agency (Groves and LaRocca, 2011; Waldman et al., 2006; Du et al., 2013; Vlachos et al. 2013). In this paper, we move this literature forward by focusing our attention into the influence of ownership (or lack of) on the CSR-related agency of executives as embedded in the specific societal context of Turkey. In this way, we move the scholarly debate on the role of executive agency in CSR practice beyond individual-level explanations towards a relational explanation that accounts for both individual and societal circumstances. Thus, our paper bridges the literatures on political CSR (Scherer and Palazzo, 2007) and on CSR practice and CSR-related agency.

Our endeavor is informed by Giddens’ (1989) conceptualization of agency as an outcome of the interplay of structural and individual influences. Very much like Giddens’ (1989) agents, owner- and professional executives exercised CSR-related agency based on their (sometimes conscious but often unconscious) interpretations of rules, and values that are effective in their context and aligned with their ownership of economic resources. For example, we found that the CSR practice seems to vary in accordance with the tendency of the firm to grow and become internationally operating. In large-scale and globally integrated corporations, CSR activities produce indirect political power, while relatively local executives seek a more traditional paternalistic power. Yet executives’ agentic capacity is mostly situated on their possession of economic capital. It should be noted that ownership type (Dam and Scholtens, 2012) and equity ownership concentration (Faller and Knyphausen-Aufseb, 2016) also affect CSR engagement. Our empirical study has allowed us to generate insights into
varying perceptions and practices of CSR activities among executives, differentiated along the lines of ownership by presenting a typology of CSR agency that accounts for structural and objective circumstances (e.g. ownership) and personal values and strategies (Figure 2). For example, for paternalist and value-based owner-executives, CSR commitment and awareness are partially an outcome of early childhood socialization and family values. For instance, these executives often have family member (e.g. father, grandfather or grandmother) with strong social values and active community involvement. Even when CSR appears to be a pragmatically-oriented activity, its rational use nevertheless necessitates a cultural acquisition of a CSR approach that is embodied in attitudes and activities. These owners also appear to be more inclined to express their vision at the societal level. The focus on the society becomes stronger as we move to the last two categories, which are labelled as paternalistic and value-based owner-executives. In fact, this focus of CSR vision also constitutes the most striking difference between the approaches of owners and non-kin professional executives, whose vision is seemingly restricted to enterprise level.

While owners present a diverse set of motives in their engagement with CSR, ranging from simplistic philanthropic drives or pursuing a simple business opportunity to a broader and holistic perspective on business-society relationships creating pluralistic definitions of value for multiple stakeholders with ultimate aims of building and sustaining institutional legitimacy of the corporation; professional executives treat CSR rationally and instrumentally so that CSR projects manifest in strategic and tactical terms for better organizational performance achieved by effective management of capital and stakeholder relationships. The main drive of professional executives is a double-faced instrumentalism: On the one side they try to apply to the specific conditions of their firm, an imported, academically thought managerial doctrine, which consists on giving priority to the good social image of the trademark represented by the corporate activity, and, on the other, they tend to convert all
administrative assets into meticulously conceived instruments of personal and institutional power. In opposition to such an instrumental attitude, the underlying motive of the owners, though they are manifested in a much more varied typology, is still to keep a part of traditional authority, the paternalistic mechanism of both social security and control, which at the end harvest a considerable reputation.

Broader definitions of CSR allow for illuminating distinctions between different types of corporate and managerial responses and motivations (Dunfee, 2013). Our empirical study has generated large and rich data, enabling us to create a typology of executives according to their CSR approaches. At the basic level, we diagnosed that some executives have no notion of CSR. Certain others, on the contrary, are not only fully aware of the CSR notion, but they see it as having a role in driving societal change or in promoting a certain vision of society. Developing an understanding of CSR by owner-executives is not solely a function of structural circumstances such as expansion and growth of the enterprise and business diversification. Their personal trajectory and cultural dispositions shape their understanding of the concept, and therefore their stance. Some owner-executives, have a larger vision of CSR and use it to affect social, political and economic change, converging with the political CSR perspective of Scherer and Palazzo (2007, 2011). At the heart of this wider scope in embracing CSR lies the pursuit of legitimacy through a sense of dialogue with multiple stakeholders (Hanlon, 2009). For these owner-executives, CSR activities go beyond the ordinary philanthropy undertaken by economic actors. Instead, CSR applications transcend boundaries of corporate objectives and traditional acts of social support and community involvement. Rather, they form a way for political involvement without being part of the established politics. Therefore, the logic of justification for CSR, in the case of owner-executives, tends to transcend boundaries between economic, ethical, political and social dimensions of CSR.
Highlighting the significant variations between owner- and professional executives, we argue that the latter, having a certain consciousness of CSR, tend to approach it as a strategic choice which is the most rational course of action given the rules and resources that inform their CSR practice. The large majority of professional executives in our sample are identified as pragmatists. Adopting an instrumentalist approach, they are more in tune with the business case for CSR and emphasize business performance and a utilitarian view of CSR as a mechanism, or simply as another managerial tool. They either engage in CSR activities for better company performance, or to negate the adverse impacts of the corporation’s actions, rather than being driven by a commitment to social betterment or acting in accordance with what is fundamentally believed to be the right thing to do (Arvidsson, 2010). Some of these executives consider CSR as a public relations tool and leave it to the discretion of the marketing department. Professional executives in larger companies take a more institutionalized approach to developing CSR programs, but still depart from a mainly pragmatic premise of CSR, with full awareness of its benefits to the company. Even being ethical is conceived in relation to power to handle the business and its potential contribution to the success of the company. This reiterates importance of executive agency, as a composite construct underscored by possession of capital and interlocking elements of power and reflexive monitoring, rationalization and motivation of action, as Giddens (1989) put forward in his dialectical matrix of agency, which we introduced earlier in the paper.

The degree of awareness observed among professional executives should be understood, not in terms of personal interests or cultural dispositions, but rather based on the fact that they are situated in relatively precarious positions in comparison to the owner. The difference between owners and professionals is also a matter of identification with the business corporation and its foundations. Professionals ideologically identify with the corporation they manage, but in most cases, they do not own the economic capital, nor do
they have underlying control of it. They are representative of the corporation, as well-equipped and highly rational individuals with certain kinds of managerial agency and expertise. Consequently, CSR is perceived by the professional executives as an asset that should be rationally and instrumentally utilized, while owner-executives present a more varied set of motives in their involvement with CSR matters. This is an important finding for CSR research because it redirects our attention back to the conditions under which CSR can become a priority for executives depending on their agentic position open to them as a function of their ownership status.

Our study is positioned within the growing literature on CSR in emerging markets. As business organizations are embedded in national institutions and a web of contextual relationships between stakeholders, CSR is a culturally, socio-economically, legally and ideologically bounded phenomenon. Various combinations of state regulations, industrial norms, stakeholder dynamics, including civil organizations, community groups may bring about different CSR approaches and applications (Campbell, 2007; Yin and Zhang, 2012). CSR practices in emerging economies are contingent upon the institutional structures in such countries (Visser, 2008; Newell and Frynas, 2007; Jamali and Sidani, 2012; Jamali, Karam, Yin and Soundararajan, 2017; Pisani, Kourula, Kolk and Meyjer, 2017). Therefore, transferability of research findings and frameworks drawn in the developed world to developing countries has been critiqued by many scholars (Jamali, 2010; Jamali and Neville, 2011; Kolk and Lenfant, 2010; Muller and Kolk, 2008; Visser, 2008). For example, as our research has also confirmed, philanthropy appears to be a prevailing form of CSR expression in the developing world due to entrenched cultural norms and values (Chapple and Moon, 2005; Ibrahim, Karatas-Ozkan and Jamali, 2012; Jamali and Neville, 2011) often embodied by religious frameworks and expectations (Visser, 2008; Jamali and Neville, 2011).
Although studies on CSR in countries with emerging economies indicate some specificities, the Turkish case presents distinct particularities due to the complex sociological characteristics of Turkey. First, we should underline that the notion of ‘social responsibility’ manifests itself in a vast variety of frameworks, which indicates on the one side the lack of corporately organized form of the concept, and on the other, the predominance of a generalized mind of transition, from traditionally-oriented mechanisms of social solidarity to rationally conceived one. As in the classical analysis of Durkheim, a society mostly dominated by agrarian activities where the ties between individuals are historically determined, the rationale of solidarity required for such a structure is the mechanical one (Durkheim, 2013). This means that human relations are regulated within a community, on the mutual control and help, which places the individuals who are economically in well-being at the position of an informal mechanism of social security. As Turkey is a country in a multiple transition from agrarian/traditional to both industrial and post-industrial modes of production in a relatively short period, social values and relations present a panoply of conflicts and contradictions, together with surviving forms of traditional residues, even in modified forms. The concept of social responsibility is one of the most salient functions in a family-firm entrepreneurship, which represents typically the extensions of traditional relations into modern managerial organizations. Second, Islamic doctrine of social aid, the zakat mechanism prevails as the clear majority of the population is Muslim. Zakat is a form of obligatory giving, based on total income and value of one’s possessions, in Islam. In the Turkish context, zakat tends to take a form of private and charitable contribution to poor. This religious rule dictating the sharing of the wealth with the needy has become a tradition with also repercussions on the business world. Furthermore, our study was able to trace back some of the more traditional forms of CSR activities to long before the introduction of the imported concept of CSR.
Our study has moved forward the scholarly debate on CSR by unpacking the impact of the ownership status on the CSR agency (i.e. practices and perceptions) of executives. Our findings enabled us to develop a typology of CSR agency of owner- and professional executives. This forms the first and core contribution of our study. Our study also enhances our understanding of the relationship between CSR and executive agency in an emerging country context, which remains understudied. Emerging country contexts often present environments whereby CSR remains to be an imported concept with insufficient understandings and grounds of justification for a multitude of applications. Understanding managerial motives and key drivers for CSR perspectives and practices in such contexts is of paramount importance. The final contribution of the paper stems from the richness of qualitative evidence collected and analyzed through rigorous procedures. Disconnect between rhetoric and reality, theory and evidence is often a source of criticism in CSR research. This article presents original evidence on both CSR perceptions and CSR practices of owner- and professional executives. Hence, our study highlights the importance of introducing self-reflection into the CSR approaches in order to unearth assumptions held by both owner- and professional executives on what CSR means and why is it worth pursuing if at all. An examination of their own CSR motives and dispositions as well as their agency as executives can help them develop more responsible leadership and carry out more proactive outlook to societal expectations. Responsiveness developed out of questioning entrenched values, motivations, drivers of social responsibility as well as managerial power can contribute to advancing CSR techniques.

Even though the unequal samples reflect the actual representations at the upper echelons in Turkish companies, the quantitative disequilibrium between owner- and professional executives is an important limitation of our study. With a greater proportion of professional executives within a relatively balanced set of interviewees, the conceptual
comparison between both universes would be more accurate. Future studies should endeavor to examine the topic from different angles, such as gender, age and educational affiliation. There is scope for comparing and contrasting the perceptual differences between female and male owner- and professional executives, but also those of older and younger generations of executives. Equally, educational profile, and hence cultural capital and cognitive schema of executives could be an interesting dimension to study. Finally, the CSR scholarship would benefit from research that demonstrates cross-cultural differences in the perception and approaches of owner- and professional executives.

First order concepts
- Existence of the concept of CSR
- Paternalistic relations
- Stakeholders and CSR matters
- Indifference towards social and environmental dimensions of the business
- Transactional pursuit of CSR
- Conformist and instrumentalist approach to CSR
- Narrow business-driven instrumentalism
- Future-oriented social engineering
- Traditions with religious underpinnings
- Philanthropic CSR activities
- Personal managerial power and agency
- Provincial background
- Humanistic and ethical concept of CSR
- Self-actualization of the owner
- Institutionalized and internalized CSR
- Affecting social change

Second order categories
- Ignorant-sensitive owner-executive
- Pragmatic owner-executive
- Paternalist owner-executive
- Value-based owner-executive

Aggregate dimensions
- Owner-executives' agency
  - Access to ownership and economic capital
  - Tradition, values and ideology
  - Politics and society; motivation of action
- Professional-executives' agency
  - Indifferent professional executive
  - Corrective instrumentalist professional executive
  - Pragmatist professional executive
  - Value-based enlightened professional executive
- Limited and underdeveloped understanding of CSR
- Conformist approach to CSR
- Economic, ethical and legal responsibilities
- Compensation for the negative impact of the corporation on the society and environment
- Environmentalist agenda
- Consequentialist instrumentalist approach to CSR
- Strategic, tactical, operational levels
- CSR as marketing instruments
- Enterprise growth
- Holistic perspective of society and role of corporations
- Stakeholder relationship management
- Enterprises with an extended ownership

Managerial capital and rationalized approach
- Enterprise focus
- Strategic and reflexive outlook
