 - Teachers
- } Social learning environment

demonstration

Studying doesn't need to be hard.

This is how we're making it easier for everyone.

- 1 Quality texts from around the world**

The Nextbook library exclusively consists of books that are used at colleges and universities. Easily access them where you want, when you want.
- 2 Create and organise notes with ease**

Take notes and highlight what's important with the click of a button. Even better: Nextbook can automatically summarise your textbook based on your studying behaviour — saving you time when you need it most.
- 3 Integrated Q&A**

The best way to learn is by teaching others. Nextbook allows you to chat with your classmates from within your textbook, so that you get the help you need, as quickly as possible.
- 4 Analyse learning behaviour**

Nextbook enables teachers to better understand their students. Our easy-to-use dashboards offer insight without effort.

AFFORDANCES & THEORETICAL UNDERPINNING

AFFORDANCES

- Collaboration
- Creativity
- Self-directed learning
- Personalized resources

THEORETICAL UNDERPINNING

- dialogic practice
- heutagogy (self-determined learning)
- student empowerment
- nurturing agency in students

Students' questions and discussions on the “discussion platform” are not connected to the course material

Result:

- No “overview” of the questions and answers (students and teachers)
- Students do not spot interesting Q&A or discussion when they are studying the content
- Students ask similar questions multiple times

CASE STUDY – ASYNCHRONOUS DISCUSSION IN NEXTBOOK

Question 9

Select this text to ask a question regarding this exercise.

Written solution

9. (6pts) Sampling: Consider the following Bayesian network.

(a) (4pts) Assume you want to obtain, as efficient as possible, ONE sample for each of the queries below using **ancestral sampling**, assuming you have a list of random and independent samples from a uniform distribution between 0 and 1 available.

Indicate for each of the queries a) if you would need rejection or not, b) list the (un)conditional probabilities available in the network that have to be sampled from, in the order they have to be sampled from, and c) order the queries according to efficiency (assuming each (un)conditional probability of the network is equally efficient to sample from).

query	rejection needed: Yes/No	ordered list of (un)conditional network probabilities	computational efficiency (1=most efficient, 3=least efficient)
$P(X_2)$	No	$P(X_1)$ $P(X_2 X_1)$	1

For the last exercise: shouldn't the expression be normalised? Because if you want to sample X_4 in practice you need to normalise it as well.

Conor O'Rourke

(already a reply, but will still handle the question in the Q&A) For sampling, the normalization does not matter as it is a `normalization_constant`, independent of the variable we want to sample. You can also check this in the lecture notes for rejection sampling for instance, there we also need to know the target distribution up to a normalization constant.

Antwo

CASE STUDY FINDINGS

POSITIVE

- Integration with LMS
- Students see questions and discussion already when viewing material
- Fewer duplicate questions
- As teacher: easier to get overview of difficult parts to be discussed in interactive session or points for improvement of material

TO BE IMPROVED

- Which questions are new?
- Analytics: how/when are students using the platform

TOWARDS USEFUL ANALYTICS

Instructional Design

meaningful
learning
traces

answer
pedagogical
questions

Basic asset.
